

Cross-border portable energy storage power supply

Does Cross-Border Interconnection capacity increase res production?

The results of scenario 3 show that adding cross-border interconnection capacity allows additional penetration of variable RES into the system and the total RES production reaches about 91.6% of the total. Further, the annual CEEP is reduced by 47% compared to scenario 2.

What is the energy storage potential?

The energy storage potential is specific to each country and it mainly depends on the availability of the resources, regulations, transmission infrastructure and energy consumption patterns.

Why is cross-border transmission capacity considered a constraint?

The cross-border transmission capacity is considered a constraint rather than an input in this study because its expansion usually depends on international agreements. Table 4. Decision variables range for each unit. 4. Results and discussions In this section, the results of the simulated scenarios and the optimisation process are introduced.
