Solar array mounted on a rooftop. A solar panel is a device that converts sunlight into electricity by using photovoltaic (PV) cells. PV cells are made of materials that produce excited electrons when exposed to light. The electrons flow through a circuit and produce direct current (DC) electricity, which can be used to power various devices or be stored in batteries.

1. What are photovoltaic (solar) systems or "PV"? A photovoltaic (PV) system uses PV cells to convert sunlight into electricity. PV cells are made of semiconductors and are used to assemble PV modules, PV systems also include inverters, to regulate and convert the solar-generated electricity from direct current to alternating current.

A ground mounted solar panel system is a system of solar panels that are mounted on the ground rather than on the roof of buildings. Photovoltaic solar panels absorb sunlight as a source of energy to generate electricity. A photovoltaic (PV) module is a packaged, and connected photovoltaic solar cells assembled in an array of various sizes.
