spec out getting a PV system with a battery setup at that point in time. If you've got tubes first and then a year or two later get a PV system everything you generate from it will be solely for YOU be that in storage in batteries or ...

Looking for some advice here. I contacted what appeared to be a reputable company (Hibernia Solar Energy, who were SEAI registered at the time with a legit VAT number etc, I checked all that out) and went through various options, had a guy come out and survey the house and went through the whole process.

Any decent solar installer should be doing a specific analysis for your particular needs. Depending on the size of the system you're looking to put in, and how many panels, you might actually restrict yourself by installing a battery. The maximum mW you're allowed to have is calculated with total solar power + battery capacity.

We got both solar thermal (evacuated tubes) and solar electric. Got them with the previous SEAI grant. The new grant scheme is supposed to be better. Our thermal is East-West and the pv is South. The thermal regularly boils over, even on cloudy days and the electric runs the meter backwards every day. We didn't get a battery, yet.

Northerly: not worthwhile in Ireland. As you move to pointing north the production from solar panels rapidly drops off, and we would not recommend it as a good financial or carbon-footprint reducing investment. Do solar panels work on cloudy days? Yes is the short answer.
