How does a photovoltaic system produce electricity?

The image represents a diagram for the production of electricity generated from a photovoltaic system. The solar radiation reaches the solar panels, or rather, the photovoltaic generator and, subsequently, the inverter transforms the continuous energy into alternating. At this point, the energy produced can be exploited in different ways:

The common single junction silicon solar cell can produce a maximum open-circuit voltage of approximately 0.5 to 0.6 volts. By itself this isn't much - but remember these solar cells are tiny. When combined into a large solar panel, considerable amounts of renewable energy can be generated. Construction of Solar Cell

Therefore, until it is significantly dark or until the solar panel is able to supply at least 0.6 V to the BC547 base, the 2N2222 remains switched off, which in turn causes the LEDs to remain shut off. Once the solar panel voltage drops below 0.6 V, the BC547 transistor slowly starts turning off, causing the 2N2222 to slowly
